

EVOLVEN Enlight™ ENVIRONMENT LIFECYCLE MANAGEMENT (ELM)

Manage Non-Production Environments.
Go Live With Confidence.™

Managing non-production environments has never been more important and yet so difficult. The complexity and ever-changing nature of today's non-production environments leads to limited visibility and far-reaching impact from environment defects, including production outages. EVOLVEN Enlight is the first Environment Lifecycle Management (ELM) solution, automating the entire lifecycle of non-production environments, from design to release into production. Organizations that are using EVOLVEN Enlight significantly reduce risks of production outages, cut costs, and improve quality.

AT A GLANCE

Environment Dynamic Blueprint

- Specifically designed to meet non-production environment challenges
- Automatically updated when changes occur

Discovery & Design

- Automatic discovery of end-to-end environments
- Aided new environments design

Portfolio Management

- Real-time view of environment and resources status
- Resource allocation
- Scheduling & integration conflict identification & resolution

Change Detection

- Change detection
- Change impact

Comparison

- Validate environment integrity and accuracy
- Root-cause analysis

Release Validation

- Validate key architecture components and configuration during transitions and releases

CHALLENGE

The growing complexity, scale and changing nature of today's non-production environments has led to a lack of visibility into non-production environments as well as to serious environmental defects and stability issues. Environment issues take a high toll on your entire application delivery process, namely: significant financial loss, delays in time-to-market, and compromised quality that leaves you guessing when the next production outage will come.

SOLUTION OVERVIEW

EVOLVEN Enlight is the industry's first Environment Lifecycle Management (ELM) solution, automating the entire lifecycle of non-production environments, from design to release into production.

With Enlight's powerful scheduling, on-going change detection, comparison and release validation capabilities, IT managers responsible for non-production environments gain visibility and control that not only cut costs and increase efficiency, but also reduce the risk of production outages, improve quality and accelerate time-to-market.

ENVIRONMENT DYNAMIC BLUEPRINT

At the heart of Enlight's capabilities lies a unique **Dynamic Environment Blueprint**. Specifically designed to meet non-production environment challenges, the Dynamic Environment Blueprint is a real-time, end-to-end view of an entire environment, including logical and physical architecture and configuration.

DISCOVERY & DESIGN

Enlight allows you to automatically discover end-to-end non-production environments, including their architecture and configuration. New environments can be designed from the ground up at any desired level of detail.

ENVIRONMENT PORTFOLIO MANAGEMENT

Achieve effective management of the entire environment portfolio with Enlight's real-time view of environment and resources status, automated allocation of environment resources, and instant identification and resolution of scheduling conflicts.

CHANGE DETECTION

Enlight's dynamic change detection capabilities allow you to automatically detect changes, prioritize them based on criticality, validate environment integrity and accuracy, and analyze the root causes of environment issues.

COMPARISON

Enlight's environment comparison enables you to validate correctness of the environment following deployment or updates, as well as to accelerate the root cause analysis of any detected environment issues.

RELEASE VALIDATION

Enlight's release validation supports the transitions between all non-production and production environments, reduces risks associated with production rollout, and helps to access and leverage environment knowledge at each step of the product lifecycle.
